Question:

Prove that the line

$$(1 \ 1)\mathbf{x} = 1 \quad (1)$$

touches the circle

$$\mathbf{x}^T \mathbf{x} - (8 \ 6)\mathbf{x} + 7 = 0 \quad (2)$$

and find the equations of the parallel and perpendicular tangents.

Solution: The general equation of a second degree can be expressed as,

$$\mathbf{x}^T \mathbf{V} \mathbf{x} + 2\mathbf{u}^T \mathbf{x} + f = 0 \quad (3)$$

Comparing (2) and (3) we get,

$$\mathbf{u} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} \quad (4)$$

$$f = 7 \quad (5)$$

If \mathbf{n} is the normal vector, \mathbf{P} is a point on that line then equation of the line can be written as,

$$\mathbf{n}^T (\mathbf{x} - \mathbf{P}) = 0 \quad (6)$$

$$\Rightarrow \mathbf{n}^T \mathbf{x} = c \quad (7)$$

where $c = \mathbf{n}^T \mathbf{P}$

Comparing (1) and (7) we get,

$$\mathbf{n} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \text{ and } c = 1 \quad (8)$$

The point of contact \mathbf{q} , of a line with a normal vector \mathbf{n} to the conic in (3) is given by,

$$\mathbf{q} = \mathbf{V}^{-1} (\kappa \mathbf{n} - \mathbf{u}) \quad (9)$$

$$\kappa = \pm \sqrt{\frac{\mathbf{u}^T \mathbf{V}^{-1} \mathbf{u} - f}{\mathbf{n}^T \mathbf{V}^{-1} \mathbf{n}}} \quad (10)$$

For a circle,

$$\mathbf{V} = \mathbf{I} \quad (11)$$

where \mathbf{I} is the Identity matrix.

Solving for κ using (10) we get,

$$\kappa = \pm 3 \quad (12)$$

$$\text{i.e. } \mathbf{q}_1 = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \text{ for } \kappa = -3 \quad (13)$$

and

$$\mathbf{q}_2 = \begin{pmatrix} 7 \\ 6 \end{pmatrix} \text{ for } \kappa = 3 \quad (14)$$

To prove that the line touches the circle at \mathbf{q} need to check that

$$\mathbf{m}^T (\mathbf{V} \mathbf{q} + \mathbf{u}) = 0 \quad (15)$$

We know that,

$$\mathbf{m}^T \mathbf{n} = 0 \quad (16)$$

$$\Rightarrow m = \begin{pmatrix} -1 \\ 1 \end{pmatrix} \quad (17)$$

Using (13), (14) and (17), the expression in (15) holds true for both \mathbf{q}_1 and \mathbf{q}_2 which means that both those points lie on the circle i.e. there will be a tangent passing through each of them which can be found out using (7)

$$\text{i.e. } \mathbf{n}^T \mathbf{q}_1 = c_1 \quad (18)$$

$$\mathbf{n}^T \mathbf{q}_2 = c_2 \quad (19)$$

where,

$$c_1 = \mathbf{n}^T \mathbf{q}_1 = \begin{pmatrix} 1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = 1 \quad (20)$$

which was already obtained in (8) and

$$c_2 = \mathbf{n}^T \mathbf{q}_2 = \begin{pmatrix} 1 & 1 \end{pmatrix} \begin{pmatrix} 7 \\ 6 \end{pmatrix} = 13 \quad (21)$$

Using (18) the given line in the question is obtained which is (1)

Therefore, the tangent parallel to (1) is,

$$\begin{pmatrix} 1 & 1 \end{pmatrix} \mathbf{x} = 13 \quad (22)$$

And the line(s) perpendicular to (1) can be found out using (8) and here the normal vector for this line will be \mathbf{m} which was calculated using (17) and its equation(s) will be,

$$\mathbf{m}^T \mathbf{x} = c_3 \quad (23)$$

$$\mathbf{m}^T \mathbf{x} = c_4 \quad (24)$$

where,

$$c_3 = \mathbf{m}^T \mathbf{q}_1 = \begin{pmatrix} -1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = -1 \quad (25)$$

$$c_4 = \mathbf{m}^T \mathbf{q}_2 = \begin{pmatrix} -1 & 1 \end{pmatrix} \begin{pmatrix} 7 \\ 6 \end{pmatrix} = -1 \quad (26)$$

Therefore, the line perpendicular to (1) and also to (22) is,

$$\begin{pmatrix} -1 & 1 \end{pmatrix} \mathbf{x} = -1 \quad (27)$$

In Fig. 1. \mathbf{C} is the center of the circle. \mathbf{q}_1 and \mathbf{q}_2 are points of contact with the circle.

Fig. 1: Tangents and Normal on the Circle

Line 1 is (1), Line 2 is (22) and Line 3 is (27).
